Financial Performance

Year

All

This financial performance page aims to show how our current operations translate to financial viability and identify points of strength and weakness.

Revenue vs. Gross Profit by Supplier

Revenue vs. Gross margin Trend

High stockout rate in Q3 indicates operational failure rather than slow season

Average Order Value vs. OTIF by Category

Frozen suffers from delivery issues despite high AOV

Revenue vs. Gross Profit by Category

Relatively close profit margins

Glossary

OTIF (On-Time In-Full): A core supply chain metric measuring the percentage of customer orders delivered complete, accurate, and within the agreed SLA timeframe.

Quality Issue Rate: The percentage of delivered items or batches that fail to meet quality standards due to defects, damage, or non-compliance.

Return Rate: The percentage of total sold items that are sent back by customers for a refund, replacement, or store credit.

Waste Units: The total quantity of inventory discarded or written off due to spoilage, expiration, physical damage, or obsolescence.

Stockout: An operational incident where inventory of a specific SKU is entirely exhausted, preventing the fulfillment of customer orders and resulting in potential lost sales.

Late Days: The total number of days a shipment or order delivery exceeds its scheduled or promised SLA delivery date.

Closing Stock: The total quantity or financial value of physical inventory remaining on hand at the end of a given accounting or operational period.

COGS (Cost of Goods Sold): The direct costs incurred to manufacture or procure the products sold by a business, including raw materials, direct labor, and manufacturing overhead.

Discount Rate: The percentage reduction applied to the regular list price of a product or service to incentivize purchases, clear inventory, or execute promotional strategies.

Revenue LY (Last Year): The total sales revenue generated during the corresponding time period in the previous calendar year, used as a baseline for Year-over-Year growth calculations.

YoY (Year-over-Year): A financial and operational evaluation method that compares a metric in a specific period against the identical period from the previous calendar year.ue minus Cost of Goods Sold, representing the percentage of total sales revenue that a company retains after incurring direct production costs.

HoReCa: An industry acronym representing the commercial food service sector comprising Hotels, Restaurants, and Cafés (or Catering).

Glossary

1. Lead-Time Quality Ripple Effect

Cross-functional analysis reveals a direct 1-month operational lag between inventory rejections and stockouts. Quality issues peaked in July due to supplier non-compliance, led by bottom-tier vendors like Eastern Food Logistics (81% OTIF) and Value Foods Wholesale (85% OTIF). These rejections depleted safety stock, and because poor supplier lead times prevented rapid replenishment, stockouts spiked to 7% in August. A secondary quality surge in October and November reflects Q4 pre-holiday production rushing by unrated suppliers. **Action:** Enforce pre-shipment audits and a 2-week buffer for low-performing suppliers ahead of peak Q3.

2. Facility Fulfillment Bottlenecks

Primary high-volume distribution hubs, Berlin Export Hub and Vilnius DC, maintain high operational velocity with an average delay of 0.11 days, benefiting from prioritized carrier scheduling and automated staging. Conversely, Riga Central DC exhibits nearly double the fulfillment delay at 0.20 days (~5 hours average hold per order) despite ranking #3 in total network revenue. This localized operational bottleneck at Riga is a primary internal driver of the network's 92% OTIF gap against our 95% target. **Action:** Re-engineer outbound staging workflows and increase carrier dispatch frequencies at Riga Central DC to align its fulfillment velocity with Berlin and Vilnius.

3. High-Value Bulk Order Staging Strain

The Frozen category generates more than double the Average Order Value (AOV) of any other category due to institutional bulk purchasing. However, processing these large palletized shipments places extreme strain on specialized cold-chain staging and refrigerated transit capacity, resulting in the network's lowest category SLA performance (89% OTIF). By contrast, shorter shelf-life categories like Baked Goods benefit from rapid ambient turnover, achieving a peak 94% OTIF.

Action: Secure dedicated refrigerated carrier capacity and implement staggered delivery scheduling specifically for high-AOV Frozen orders to protect top-line revenue from SLA failures.
